Dear Mr. Parrish:

Re: Columbia Generating Station – Support for License Renewal

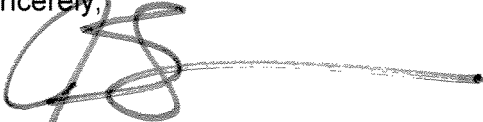

Infinia Corporation strongly supports Energy Northwest in its process to renew the operating license for the Columbia Generating Station.

For more than a quarter century, the Columbia Generating Station has been a vital part of the region's energy mix. Nuclear energy plays an important role in diversifying the sustainable energy sources necessary for achieving energy security. In addition to nuclear power, Energy Northwest is actively involved with hydro, wind, and solar projects and all of these projects are important to the area's continued growth and prosperity. The Mid-Columbia region of Washington State is uniquely situated in terms of sustainable energy resources which include solar, wind, hydro, geothermal, biofuels – and, with the Columbia Generating Station, nuclear power.

The power generated by the continued operation of the Columbia Generating Station, along with the power to come from sustainable energy programs such as the solar projects being developed by Infinia, provide the basis for the region's economic engine and support the projected future energy demands. These power projects provide a continued employment for a significant number of fulltime workers and ensure economic stability in the region – while reducing the dependence on foreign oil and improving energy security.

As such, Infinia strongly supports the renewal of the Columbia's operating license to extend plant operations through 2043.

Sincerely,

J.D. Sitton
